

# EE211: Robotic Perception and Intelligence

## Lecture 1 Introduction

Jiankun WANG

Department of Electronic and Electrical Engineering  
Southern University of Science and Technology

Undergraduate Course, Sep 2024

# Outline

1 Course Introduction

2 Linux Introduction

3 ROS Introduction

# Outline

1 Course Introduction

2 Linux Introduction

3 ROS Introduction

- **Instructor** Jiankun WANG

- Email: wangjk@sustech.edu.cn
- Address: Room 709, South Tower, College of Engineering

- **Teaching Assistants**

- Siyuan Wang, 12012324@mail.sustech.edu.cn
- Biru Zhang
- Jielin Wu

- **Lectures**

- Address: Room 305, Teaching Building 1
- Time: Tue 1-2 weekly (1-16)

- **Lab**

- Address: Room 120, South Tower, College of Engineering
- Time: Tue 3-4 weekly (1-16)

# Course Description

- Introduce the commonly used sensors and their working principles in robots, including inertial sensing, GPS and odometry, 3D vision for navigation and grasping tasks, visual servoing, and multi-sensor data fusion.
- Introduce the intelligent planning methods in different robot tasks.
- (TBD) Introduce the commonly used robot learning algorithms.

# Course Description

- Understand the working principle of common sensors.
- Understand basic robot motion and path planning algorithms.
- (TBD) Understand basic robot learning algorithms.
- Use robotic perception and intelligence to complete a specific robot task through teamwork.

- Lectures & Lab & Assignments
- Textbook and Supplementary Readings
  - Siciliano, B., & Khatib, O. (2016). Springer handbook of robotics
  - Lynch, K. M., & Park, F. C. (2017). Modern robotics
  - Thrun, S., Burgard, W., & Fox, D. (2005). Probabilistic robotics
  - Bishop, C. M., & Nasrabadi, N. M. (2006). Pattern recognition and machine learning
- Academic Papers from ICRA, IROS, RAL, TRO, TASE, IJRR

# Course Contents

No.	Dates	Contents
1	Sep.10	Introduction
2-4	Sep.17-Oct.1	Trajectory Generation, Motion Planning
5-7	Oct.8-Oct.22	Basic & advanced planning algorithms
8-10	Oct.29-Nov.12	Different sensors for perception
11-14	Nov.19-Dec.10	Sensor information processing
15-16	Dec.17-Dec.24	Robot learning if possible

# Course Assessment

- Assignment and Sign-in **30%**
  - Sign-in or quiz **5%**
  - 3 assignments **25%**
- Project **30%**
  - Conduct real-world robot experiments (80 pts.)
  - Presentation (20 pts.)
- Final Examination **40%**
  - Closed-book exam

# Project Description

- Specific task: Conduct real-world robot experiments involving mobile navigation and grasping
- Teamwork: **3?** persons in each group
- Evaluation metric: Announced later

## 机器人感知与智能课程 (EE211) 课程成果展

王建坤

机器人智能与感知重点实验室 (π Lab)

# Outline

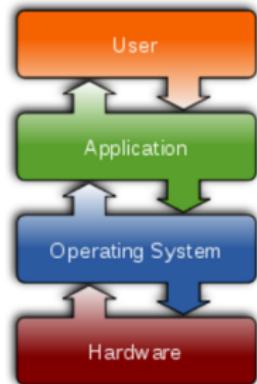

1 Course Introduction

2 Linux Introduction

3 ROS Introduction

# Operating systems

- **operating system:** Manages activities and resources of a computer.
  - software that acts as an interface between hardware and user
  - provides a layer of abstraction for application developers
- features provided by an operating system:
  - ability to execute programs (and multi-tasking)
  - memory management (and virtual memory)
  - file systems, disk and network access
  - an interface to communicate with hardware
  - a user interface (often graphical)
- **kernel:** The lowest-level core of an operating system.

- The UNIX operating system was born in the late 1960s. It originally began as a one man project led by Ken Thompson of Bell Labs, and has since grown to become the most widely used operating system.
- In the time since UNIX was first developed, it has gone through many different generations and even mutations.
  - Some differ substantially from the original version, like Berkeley Software Distribution (BSD) or **Linux**.
  - Others, still contain major portions that are based on the original source code.
- An interesting and rather up-to-date timeline of these variations of UNIX can be found at <http://www.leenez.com/unix/history.html>.

- Linux: A kernel for a Unix-like operating system.
  - commonly seen/used today in servers, mobile/embedded devices, ...
- GNU(a recursive acronym for "GNU's Not Unix!"): A "free software" implementation of many Unix-like tools
  - many GNU tools are distributed with the Linux kernel
- distribution: A pre-packaged set of Linux software.
  - examples: Ubuntu, Fedora
- key features of Linux:
  - open source software: source can be downloaded
  - free to use
  - constantly being improved/updated by the community

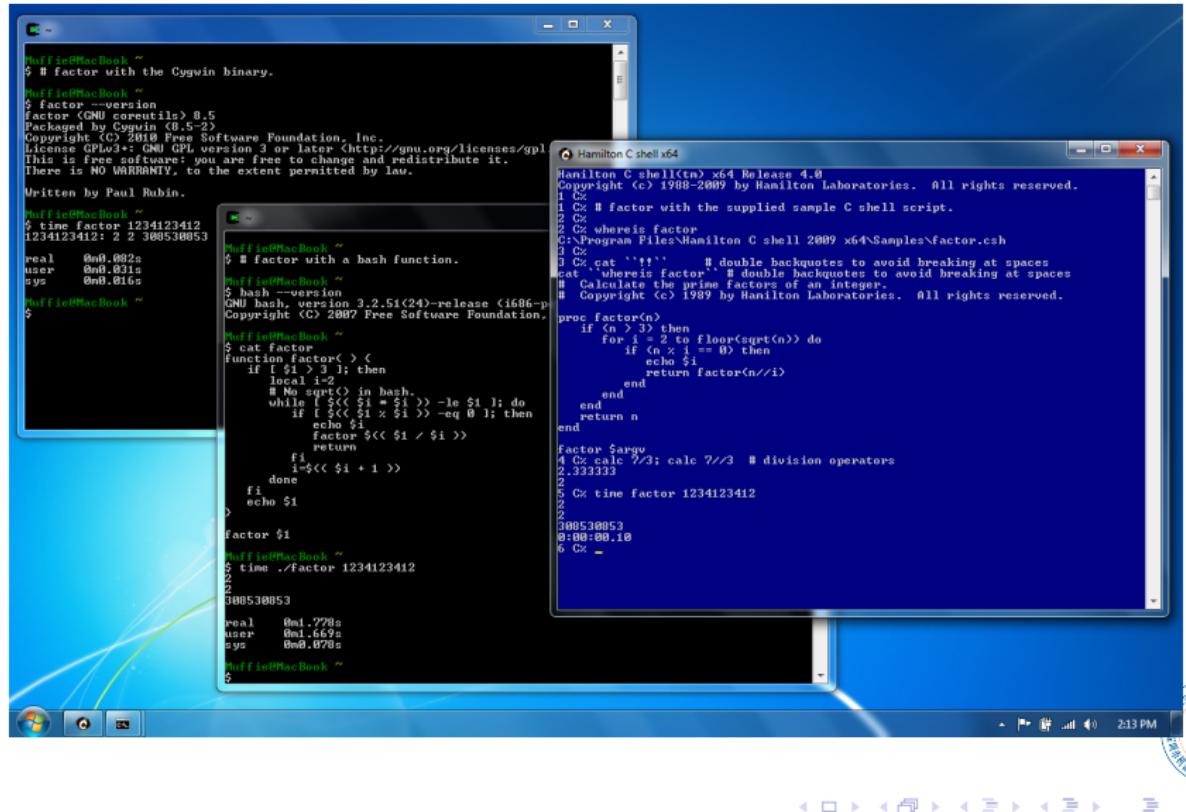

# Linux Distributions

 redhat	 MEPIS	 turboLinux	 LUNAR	 EvilEntity	 debian	 Vine Linux	 cAos/CentOS	 MiniKazit	 UTUTO
 archlinux	 m0n0wall	 jammy	 Knoppix STD	 gentoo linux	 DeLi Linux	 Hiweed	 amlug	 slackware Linux	 yellow dog Linux
 Fedora	 LPC	 PLD	 SLAX	 CORE! LINUX	 Progeny	 GEEKBOX	 BIGLINUX	 FREEDUC	 Lycoris
 EnGarde	 MandrakeLinux	 Beatrix	 Linspire	 SuSE	 Ubuntu	 YOPER	 BearOps	 ASPLinux	 kalango
 Slackintosh	 Frugalware	 Foresight	 Mint	 PCLinuxOS	 Haydar Linux	 sabayon	 Ubuntu	 JULEX	 blag

- Shell: An interactive program that uses user input to manage the execution of other programs.
  - A command processor, typically runs in a text window.
  - User types commands, the shell runs the commands
  - Several different shell programs exist. bash-the default shell program on most Linux/Unix systems. Other shells: Bourne, csh, tsch
- Why should I learn to use a shell when GUIs exist?

# Shell Example

```
Muffie@MacBook ~
$ # factor with the Cygwin binary.

Muffie@MacBook ~
$ factor --version
factor (GNU coreutils) 0.5

# Graphical User Interfaces (GUIs)

- When you logon locally, you are presented with graphical environment.
- You start at a graphical login screen. You must enter your username and password. You also have the option to choose from a couple session types. Mainly you have the choice between Gnome and KDE.
- Once you enter in your username and password, you are then presented with a graphical environment that looks like one of the following...

# Command Line Interface

- You also have access to some UNIX servers as well.
  - You can logon from virtually any computer that has internet access whether it be Windows, Mac, or UNIX itself.
- In this case you are communicating through a local terminal to one of these remote servers.
  - All of the commands actually execute on the remote server.
  - It is also possible to open up graphical applications through this window, but that requires a good bit more setup and software.

## Why use a shell?

- faster
- work remotely
- programmable
- customizable
- repeatable

# Shell commands

command	description
exit	logs out of the shell
ls	lists files in a directory
pwd	print the current <u>working</u> <u>directory</u>
cd	changes the working <u>directory</u>
man	brings up the manual for a command

```
$ pwd
/homes/iws/rea
$ cd CSE391
$ ls
file1.txt file2.txt
$ ls -l
-rw-r--r-- 1 rea      fac_cs 0 2016-03-29 17:45 file1.txt
-rw-r--r-- 1 rea      fac_cs 0 2016-03-29 17:45 file2.txt
$ cd ..
$ man ls
$ exit
```

# Relative directories

directory	description
.	the directory you are in ("working directory")
..	the parent of the working directory (.../.. is grandparent, etc.)
~	your <u>home</u> directory (on many systems, this is /home/ <i>username</i> )
<u>~</u> <i>username</i>	<i>username</i> 's <u>home</u> directory
~/Desktop	your desktop

# Directory commands

command	description
ls	list files in a directory
pwd	print the current <u>working directory</u>
cd	<u>changes</u> the working <u>directory</u>
mkdir	create a new directory
rmdir	delete a directory (must be empty)

- some commands (cd, exit) are part of the shell ("builtins")
- others (ls, mkdir) are separate programs the shell runs

- OS does not have to use a graphical interface.
  - The OS itself (the kernel) is incredibly small.
  - The GUI just another application (or set of applications) that can be installed and run on top the existing text-based OS.
- File system differences.
  - Windows typically uses FAT32 or NTFS file systems; Linux typically uses the ext2 or ext3 file systems.
  - Windows lists all drives separately (A:,C:,D:, etc...), with “My Computer” at the highest level; UNIX starts its highest level at “/” and drives can be mounted anywhere underneath it.

# Outline

1 Course Introduction

2 Linux Introduction

3 ROS Introduction

# Before ROS

- Lack of standards
- Little code reusability
- Keeping reinventing (or rewriting) device drivers, access to robot's interfaces, management of onboard processes, inter-process communication protocols, ...
- Keeping re-coding standard algorithms
- New robot in the lab (or in the factory) → start re-coding (mostly) from scratch

# Robot Operating System (ROS)

- ROS is an open-source robot operating system
- A set of software libraries and tools that help you build robot applications that work across a wide variety of robotic platforms
- Originally developed in 2007 at the Stanford Artificial Intelligence Laboratory and development continued at Willow Garage
- Since 2013 managed by OSRF (Open Source Robotics Foundation)

- The operating system side, which provides standard operating system services such as: hardware abstraction
  - low-level device control
  - implementation of commonly used functionality
  - message-passing between processes
  - package management
- A suite of user contributed packages that implement common robot functionality such as SLAM, planning, perception, vision, manipulation, etc.

- **Peer to Peer:** ROS systems consist of many small programs (nodes) which connect to each other and continuously exchange messages
- **Tools-based:** There are many small, generic programs that perform tasks such as visualization, logging, plotting data streams, etc.
- **Multi-Lingual:** ROS software modules can be written in any language for which a client library has been written. Currently client libraries exist for C++, Python, LISP, Java, JavaScript, MATLAB, Ruby...
- **Thin:** The ROS conventions encourage contributors to create stand-alone libraries/packages and then wrap those libraries so they send and receive messages to/from other ROS modules.
- **Free & open source, community-based, repositories**
